Data Structures: Binary Search Trees and Queues

A Queue is a linear structure that follows the First-In First-Out (FIFO) principle.

A Binary Search Tree (BST) is a node-based binary tree data structure.

In a BST, all keys in the left subtree are smaller than the node key.

All keys in the right subtree are greater than the node key.

Inorder traversal of a BST yields keys in sorted ascending order with O(N) complexity.
